

ABSOLUTE DRYING PERFORMANCE

A new dimension in drying technology.

TurboDry fabrics biomimic the moisture movement method that trees use to move water from their roots to their leaves.

This process moves moisture from the inside to outside of the fabric enabling maximum comfort and superior drying speeds. TurboDry is the ideal solution for endless apparel and textile applications.

Performance

- TurboDry moves moisture away from skin while normal wicking fabrics retain sweat next to skin
- Positive One-Way Transport Capacity (OWTC) indicates a fabric is dryer on inside than on the outside resulting in sustained comfort
- TurboDry fabrics display higher OWTC than leading competitors and often improve in performance after washing

Industry Standard Comparison

One-Way Transport Capability

Wicking

Dry Time

Note: The fabric used in this study is a knitted synthetic material comprised of 88% Polyester, 12% Spandex weighing 150 gsm.

We looked to nature for a new dimension in performance

Pulls sweat away from body. 100x drier next to skin.

Permanent moisture control that does not wash out.

Engineered yarn for quick moisture absorption.

TurboDry fabrics feature patent-pending technology that leverage non-chemical capillary forces to transport moisture away from skin. This moisture movement is creating a new dimension in drying technology.

Sustainability

- All TurboDry fabrics are bluesign® and OEKO-TEX® STANDARD 100 Certified and are PFC-free
- TurboDry fabrics utilizing recycled fibers show no performance degradation
- The TurboDry Eco line contains same-type synthetic yarns which can allow for future recycling
- TurboDry fabrics can help achieve lower Higg Materials Sustainability Index (MSI) Scores

Uses

- TurboDry can be used for virtually any apparel and textile application, keeping a wide range of users drier and more comfortable.
- TurboDry technology is currently implemented in warp-knit fabrics, weft-knit fabrics, and narrow elastics.
